# **Tesseract LASAGNA: MVP PWA Framework**

# Concept

**Tesseract LASAGNA** is a fast, modern and modular PHP OOP framework for rapid prototyping of **Progressive Web Apps** (PWA). Tesseract uses *Google Sheets CSV exports* as a data input, it builds the Model from CSV layers (hence the LASAGNA codename).

Abstract based **Presenters** are used to process the **Model** and to export resulting data in TEXT, JSON, XML or HTML5 formats (or any other custom format). **View** is built as a set of Mustache templates and *partials* (Mustache can be also rendered in the browser via JavaScript).

Tesseract is *Composer components* based, the Model defines a complex **RESTful API**, has a *command line interface* (CLI) and incorporates *continuous integration* (CI) testing.

Tesseract uses no classical database models and structures, so it is quite easy to implement all types of scaling and integration. The access model is based on the **master key encrypted cookie**.

# **Basic Functionality**

#### **Index**

Tesseract starts parsing the **www/index.php** file, that's targeted at the Apache level via **.htaccess** configuration file using *Mod\_rewrite*. **Index** can contain various constant definitions and overrides. **Index** then loads the **Boostrap.php** core file from the aplication root folder.

### **Bootstrap**

**Bootstrap** sets core constants and the application environment, **Nette Debugger** is also instantiated on the fly. Bootstrap then loads the **App.php** core file from **app**/ folder (the location can be overriden via a constant).

### App

**App** processes the application configuration files (public and private), sets caching mechanisms (optional Redis database support), configures URL routing, emmits CSP headers and sets the core **Model** (multidimensional array). **App** then loads the corresponding *presenter* based on the actual URI and the coresponding route. It can also run a *CLI presenter*, if the CLI is detected.

When the *presenter* returns an updated Model, the output is echoed and final headers are set (including some optional debugging information). Runtime ends here.

#### Router

**Router** is a part of the **App** script and is defined by joining several routing tables (NE-ON format) in the **/app** folder.

- router\_defaults.neon default values (global)
- router\_core.neon core Tesseract funcionality (global)
- router\_admin.neon administrative routes (global)

- router\_extras.neon extra features (optional)
- router\_api.neon API calls here
- router.neon web app pages

#### **Presenter**

**Presenter** is a subclass instance based on an *abstract class* **APresenter.php** and defines at least the *process* method, that is called from the **App**. The *process* method can either output the resulting data or return it encapsulated inside the Model back to the **App** for rendering.

# Filesystem Hierarchy

- apache/ Apache configuration example
- app/ Presenters and NE-ON configurations
- bin/ bash scripts for Makefile
- ci/ Continous Integration logs
- data/ private data, encryption keys, CSV imports, etc.
- doc/ phpDocumentor generated documentation
- docker/ files to be inserted into the Docker container
- logs/ system logs
- node\_modules/ Node.js modules used by Gulp
- temp/ temporary files, Mustache compiled templates
- vendor/ Composer generated vendor classes
- www/ static assets
  - www/cdn-assets/ repository version hash-links to www/
  - www/css/ CSS classes
  - www/docs/ link to doc/
  - www/download/ downloadable files
  - www/epub/ ePub files
  - www/img/ images
  - www/js/ JavaScript files
  - www/partials/ Mustache partials
  - www/summernote/ Summernote editor
  - www/templates/ Mustache templates
  - www/upload/ uploads via administration panel
  - www/webfonts fonts

### **Constants**

### Bootstrap.php

- APP application folder
- CACHE cache folder
- CLI TRUE if running from command line interface
- **CONFIG** public configuration file
- **CONFIG\_PRIVATE** *private configuration* file
- CSP CSP HEADERS configuration file
- DATA application data folder, also private data goes here
- DOWNLOAD download folder
- DS operating system directory separator
- ENABLE\_CSV\_CACHE enable use of extra curl\_multi CSV cache
- LOCALHOST TRUE if running on local server
- LOGS log files folder
- PARTIALS Mustache partials folder
- ROOT root folder
- **TEMP** *temporary files* folder
- TEMPLATES templates folder
- UPLOAD upload folder
- WWW static assets folder, also Apache root

# App.php

- CACHEPREFIX cache name prefix
- DOMAIN domain name
- SERVER server name
- PROJECT project name
- APPNAME application name
- MONOLOG Monolog log filename
- GCP\_PROJECTID Google Cloud Platform project ID
- GCP\_KEYS Google Cloud Platform JSON auth keys base filename (in app/)

# **Administration**

### **Authentication**

Tesseract login is based solely on the Google OAuth 2.0 client right now.

When the user logs in, a special encrypted cookie - a master key - is created and set via HTTPS protocol. This cookie is protected from tampering and its parameters can be modified in the administration panel, or remotely via authenticated API calls.

There is no database of connections or authenticated users at all. The default login URL is /login and the default logout URL is /logout.

#### **Permissions**

Tesseract has built-in three basic permission levels, that can be easily extended.

Core levels are: 1) **admin** - superuser, 2) **editor** - can refresh data and edit articles, 3) **tester** - no elevated permissions, 4) **authenticated user** - rights the same as level 3, and 5) **unauthenticated user** - unknown identity.

### **Remote Calls**

**TBD** 

# **Core Features**

### **Web Pages**

TBD

#### **Translations**

TBD

#### **PWA Manifest**

**TBD** 

#### **Service Worker**

TBD

#### **Icons**

**TBD** 

#### **Fonts**

TBD

### **Sitemaps**

Tesseract generates TXT and XML sitemaps based on the routing tables.

### **CSP Headers**

You can define headers for *Content Security Policy* in **app/csp.neon** file.

# **Extra Features**

### **Articles**

**TBD** 

### **QR** Images

The route goes as qr/[s|m|l|x:size]/[:trailing]. The Hello World example is as follows: [https://lasagna.gscloud.cz/qr/s/Hello%20World]

# **EPUB Ebook Reader**

TBD

# **Pingback Monitoring**

See the live demo at this URL: [https://lasagna.gscloud.cz/pingback]

### **Data Exports**

**TBD** 

## **Android Data Exports**

TBD
